

TECHNICAL DATA SHEET

UV-TOP COAT ANTI-SCRATCH

UV-curing Top Coat for roller application on parquet and veneer floors with extremely high scratch resistance.

QUALITIES

UV-Top Coat Anti-Scratch was developed with the target of making a significant improvement in the scratch resistance of pre-finished parquet.

The resistance of Anti-Scratch to scratches and sanding marks caused by hard dirt particles and sand is, when compared to conventional UV-Top Coats, a manifold higher! UV-Top Coat Anti-Scratch does not show any abrasive effect toward whatever is working on the surface - making it the perfect coating for our every day needs! Top Coats Anti-Scratch can be sanded and is therefore easy to re-coat. Anti-Scratch not only has a very good scratch resistance, but also a high transparency so that application on dark wood types (tropical wood) is not a problem.

Anti-Scratch corresponds to DIN 4102 class B1 (non-readily ignitable) as well as DIN 68861 class 1B (behaviour at chemical influence). In most cases, the lacquer technical details (i.e. scratch resistance, chemical resistance) are far more superior to that of conventional 2-component PUR lacquers.
